# JNS supports custom manufacturing in cutting-edge industries where high precision and high performance are required.

## Product lineups that meet cutting-edge industry needs

Our needle bearing products boast high-precision, high-rigidity, and high-durability. They are widely used in production lines for advanced products, such as digital home appliances, as well as in manufacturing facilities for semiconductor manufacturing devices, precise construction machinery, and electron microscopes. Our technology supports every type of industry in the world.

## A substantial variety of products delivered promptly

Aside from providing our customers with a stable supply of products, immediate delivery has been the standard at Nose Seiko for many years. We achieve this through our flexible and efficient production system—the result of extensive industry experience—that ensures we are always able to keep an extensive array of products on hand. Nose Seiko strives to provide optimum convenience for customers, responding to emergency orders within the shortest possible delivery time. Our customers appreciate our commitment to high standards.

### PRODUCTS

### JNS

#### Needle Roller Bearings

A needle roller bearing featuring high-precision rigid outer rings and retainers. Its space-saving design provides low cross-sectional height.

#### Cam Followers

Our stud-type cam followers have a thick outer ring and can support heavy radial loads. They are designed for applications where the outer ring rotates. Also available in miniature models.

#### Roller Followers

Our roller followers have a thick outer ring to support large radial loads. This bearing is designed for applications where the outer ring rotates.

#### Needle Roller Bearings (STAINLESS STEEL)

A durable stainless-steel bearing that is rust- and corrosion-resistant. Used in lithium ion battery intergrated system, semi-conductors, medical equipments, and food machinery.

#### Cam Followers (STAINLESS STEEL)

A durable stainless-steel bearing that is rust- and corrosion-resistant. Used in cutting-edge technological fields for anticorrosive, clean, and vacuum applications.

#### Roller Followers (STAINLESS STEEL)

A durable stainless-steel bearing that is rust- and corrosion-resistant. Used in cutting-edge technological fields for anticorrosive, clean, and vacuum applications.

**JNS provides the highest quality products to fulfill satisfaction of the worldwide customers.**

**GLOBAL NETWORK**

**JNS**

**In order to fulfill satisfaction of the worldwide customers**

Nose Seiko consistently answers any type of orders by supplying products with best quality all the time. Thanks to such assurance for the quality, it promises comfortable and secure purchasing of whatever product required whenever needed for the customers all over the world.

**The JNS network spans over 50 countries**

Our network of sales distributors currently over 50 countries in North and South America, Europe, Asia, Oceania, the Middle East, and Africa. The extensive scale of our network is a proof of the superior quality of our delivery system, which proves trust in the worldwide customers.

# NEEDLE ROLLER BEARINGS

# 1 Bearing Life and Load Rating

## 1-1 Bearing life

Bearings are subjected to certain intensity of repeating stress on their track ring and rolling element even during operation under proper loading, appropriate mounting and sufficient lubrication. The stress may cause scaly damage formed on surface after certain time period due to its concentration at shallow vicinity under the surface. This phenomenon is called flaking (peeling-off of surface). Phenomenon that causes bearing to be unusable due to flaking caused by repeating cyclic stress under normal operating condition is called "life" of the bearing. Generally, bearing life is defined by total number of rotation of the bearing until flaking is generated on track surface. However, recognizing average life as criteria of bearing life is not appropriate for actual selection of bearing since fatigue limit of material varies. It shall be practical to consider the life guaranteed to most bearings (basic rating life) as a criterion. Phenomenon that bearing becomes inoperative due to heat-seizure, wear, fracture, scoring are regarded as "failure" caused by operating conditions and selection of bearing so that they and the life should be considered as different phenomena.

## 1-2 Basic rating life

Basic rating life of bearing shall be defined as a total number of rotation that 90% of the group of the same bearings can run without causing flaking due to rolling fatigue when they are operated under the same conditions.

In the case of rotation in certain constant speed, the basic rating life can be expressed in a total rotation time as well.

## 1-3 Basic dynamic load rating

A given static radial load under which a bearing theoretically endures basic rating life of one million rotations is referred to as a basic dynamic load rating.

## 1-4 Dynamic equivalent load

### Dynamic equivalent radial load

A load that is virtually applied to the center of a bearing under which to obtain a life equivalent to that when both radial load and axial load are subjected to the bearing at the same time is called the dynamic equivalent radial load. In the case of needle bearing, its radial type is capable for loading radial load only so that just a radial load will be applied.

## 1-5 Bearing life calculation formula

The following relationship is applied to basic rating life, basic dynamic load rating and dynamic equivalent load of bearing.

$$L_{10} = (Cr / Pr)^{10/3} \dots\dots\dots (1.1)$$

$L_{10}$  : Basic rating life  $10^6$ rotation

$Cr$  : Basic dynamic load rating N

$Pr$  : Dynamic equivalent radial load N

Basic rating life time can be expressed as total rotation time with given rotation per minute by the following formula.

$$L_h = 10^6 L_{10} / 60n = 500 f_h^{10/3} \dots\dots\dots (1.2)$$

$$f_h = f_n Cr / Pr \dots\dots\dots (1.3)$$

$$f_n = (33.3 / n)^{3/10} \dots\dots\dots (1.4)$$

$L_h$  : Basic rating life expressed in hour h

$n$  : Rotation per minute rpm

$f_h$  : Bearing life factor

$f_n$  : Speed factor

## 1-6 Operating conditions and bearing life factor of bearing

### Operating machinery and demanded life

Bearings should be selected based on setting up demanded life in accordance with operating machinery and operating condition.

Demanded life is determined by endurance duration for operating machinery and reliable operating periods.

Table-1 indicates demanded life that can be a typical reference.

Table-1 Operating condition and demanded life time factor (reference)

| Operating conditions                                                                  | Bearing life factor $f_h$                 |                                                                                   |                                                           |                                                                                     |                                             |

| Operate 24 hours a day and must be non stop without accident                          |                                           |                                                                                   |                                                           |                                                                                     | Water-work system<br>Power generator system |

## 1-7 Corrected rating life

Formula for basic rating life described above is applied to bearings whose reliability is 90%, whose material is for general purpose bearing and are manufactured in general quality standard as well as those operated under standard operating conditions. Corrected rating life should be calculated using correction factor  $a_1$ ,  $a_2$  and  $a_3$  in the case that the reliability is over 90% or that life needs to be obtained for special bearing properties or for special operating conditions.

$$L_{na} = a_1 a_2 a_3 L_{10} \dots \dots \dots (1.5)$$

- $L_{na}$  : Adjustment rating life  $10^6$  rotation
- $a_1$  : Reliability factor
- $a_2$  : Bearing special properties factor
- $a_3$  : Operating conditions factor

### 1-7-1 Reliability factor

#### Reliability factor $a_1$

This is the bearing life corrected factor for reliability (100-n) % when probability of failure is n %. Value of the reliability factor  $a_1$  is shown in Table-2.

Table-2 Reliability factor  $a_1$

| Reliability (%) | $L_n$    | $a_1$ |
|-----------------|----------|-------|
| 90              | $L_{10}$ | 1     |
| 95              | $L_5$    | 0.62  |
| 96              | $L_4$    | 0.53  |
| 97              | $L_3$    | 0.44  |
| 98              | $L_2$    | 0.33  |
| 99              | $L_1$    | 0.21  |

### 1-7-2 Bearing special properties factor

#### Bearing special properties factor $a_2$

Bearing special properties factor  $a_2$  is used for adjusting variation of properties concerning life in the case that material type, quality or manufacturing process is special. This factor shall be  $a_2=1$  for standard material and manufacturing method. It can be  $a_2 > 1$  when special modified material or manufacturing method is used due to improved quality of bearing material or progress of manufacturing technology.

### 1-7-3 Operating conditions factor

#### Operating conditions factor $a_3$

This is a factor to adjust impact of operating conditions of bearing, especially effect of lubrication to fatigue life. Bearing life is essentially a fatigue phenomenon of surface layer which is subjected to repeating cyclic load. Therefore, this factor will be  $a_3=1$  under ideal lubrication condition when rolling element and track surface are completely isolated by oil film and surface failure can be ignored. Under poor lubrication condition such as low lubricant viscosity or under significantly slow rotation speed of rolling element, it would be  $a_3 < 1$ .

On the contrary, it can be  $a_3 > 1$  under especially excellent lubrication condition. Generally, the bearing special properties factor  $a_2$  can not be set to value exceeding 1 when  $a_3 < 1$ .

## 1-8 Adjustment of Basic Dynamic Load Rating for temperature and hardness factors

### 1-8-1 Temperature factor

While operating temperature of bearing is individually defined in accordance with material and structure, bearing is capable to be used at temperatures higher than 150 °C by applying special treatment for thermal resistance. However this will cause reduction of basic dynamic load rating as a result of reduction of permissive contact stress. Basic dynamic load rating with consideration for temperature increase is given by the following formula.

$$C_1 = f_1 Cr \dots \dots \dots (1.6)$$

- $C_1$  : Basic dynamic load rating with consideration for temperature increase N
- $f_1$  : Temperature factor (Refer to Figure-1)
- $Cr$  : Basic dynamic load rating N

Figure-1

### 1-8-2 Hardness factor

The raceway surface should be HRC58 to 64 in the case of using shaft or housing as raceway instead of bearing inner ring or outer ring respectively. Basic dynamic load rating may be reduced in the case the surface hardness is lower than HRC58. Basic dynamic load rating with consideration for surface hardness is given by the following formula.

$$C_2 = f_2 Cr \dots \dots \dots (1.7)$$

- $C_2$  : Basic dynamic load rating with consideration for hardness N
- $f_2$  : Hardness factor (Refer to Figure-2)
- $Cr$  : Basic dynamic load rating N

Figure-2

### 1-9 Basic static load rating

Basic static load rating is specified as a static load which corresponds to contact stress indicated in the table below at rolling element and the center of contact of track that are subjected to the maximum load. Total permanent deformation of rolling element and track occurred by the contact stress may be approximately 0.0001 times of diameter of the rolling element.

| Type of bearing | Contact stress MPa |
|-----------------|--------------------|
| Roller bearing  | 4000               |

## 1-10 Static equivalent load

A load that is virtually applied to the center of a bearing under which to obtain a contact stress equivalent to the maximum contact stress that occurs at contact surface between rolling element and track, when both radial load and axial load are subjected to the bearing at the same time, is called a static equivalent load.

In the case of needle bearing, its radial type is capable for loading radial load only so that just a radial load will be applied.

$$P_{Or} = F_r \dots\dots\dots (1.8)$$

$P_{Or}$  : Static equivalent radial load N

## 1-11 Static safety factor

Although permissive limit of static equivalent load is typically regarded as basic static load rating, its limit shall be set with consideration for safety since conditions required for bearings broadly vary. The static safety factor  $f_s$  is given by the following formula (1.9). Table-3 shows its typical values.

$$f_s = \frac{C_{Or}}{P_{Or}} \dots\dots\dots (1.9)$$

$f_s$  : Safety factor

$C_{Or}$  : Basic static load rating N

Table-3 Static safety factor

| Operating conditions of bearing                  | $f_s$      |
|--------------------------------------------------|------------|
| With high rotation accuracy<br>With impact load  | $\geq 3$   |
| With standard rotation accuracy                  | $\geq 1.5$ |
| With standard rotation accuracy<br>and low speed | $\geq 1$   |

## 1-12 Permissive rotation speed

Increasing bearing rotation speed may cause a rise in bearing temperature due to abrasion heat generated inside of the bearing, which results in failure with heat-seizure. A threshold rotation speed up to which long duration of safe operation is enabled is referred to as a permissive rotation speed.

Permissive rotation speed varies depending on type, size and load of bearing, lubrication method and its radial clearance. It is an experimental value at which operation is enabled without causing heat generation exceeding certain limit.

## 2 Bearing load

### 2-1 Load factor

Operation in actual machinery is subjected to a load larger than theoretical axial directional load due to vibration and impact shock.

Actual load is given by calculation of load applied to axes system using load factor shown in Table-4.

$$K = f_w \cdot K_c \dots\dots\dots (2.1)$$

$K$  : Actual load applied to axes system N

$K_c$  : Theoretical calculation value N

$f_w$  : Load factor (Table-4)

Table-4 Load factor

| Degree of load                            | Examples                                                   | $f_w$   |
|-------------------------------------------|------------------------------------------------------------|---------|
| Smooth motion without any impacts         | Air conditioner, measurement instruments, office equipment | 1 ~1.2  |
| With standard rotation                    | Gear box, vehicle, paper-making machine                    | 1.2~1.5 |
| Operation with vibration and impact shock | Rolling machine, construction machinery, crusher           | 1.5~3   |

### 2-2 Load distribution

#### Load distribution to bearing

Axis system is assumed as a static beam supported by bearings in order to distribute load acting on the axes system to the bearings. Table-5 shows calculation example of load distribution.

Table-5 Example of calculation of load distribution

| Examples | Load calculation                                                            |
|----------|-----------------------------------------------------------------------------|
|          | $F_1 = \frac{W_1(b+c) + W_2c}{a+b+c}$ $F_2 = \frac{W_1a + W_2(a+b)}{a+b+c}$ |
|          | $F_1 = \frac{W_1(a+b+c) + W_2c}{b+c}$ $F_2 = \frac{W_2b - W_1a}{b+c}$       |

## 2-3 Load transmission

### Bearing loads in belt or chain transmission

The force acting on pulley or sprocket wheel when power is transmitted by a belt or chain is given by the following formula.

$$T = 9550P/N \dots \dots \dots (2.2)$$

$$F_t = 2000 \cdot T/d \dots \dots \dots (2.3)$$

- T** : Torque acting on pulley or sprocket wheel N·m
- F<sub>t</sub>** : Effective force transmitted by belt or chain N
- P** : Transmitted power kW
- N** : Rotation per minute rpm
- d** : Effective diameter of pulley or sprocket wheel mm

Load  $F_r$  acting on pulley shaft is given by multiplying effective transmitted force  $F_t$  by belt factor  $f_b$  shown in Table-6 in the case of belt transmission.

$$F_r = f_b F_t \dots \dots \dots (2.4)$$

Table-6 Belt factor

| Type of belt                       | $f_b$  |
|------------------------------------|--------|
| V belt                             | 2 ~2.5 |
| Flat belt (with tension pulley)    | 2.5~3  |
| Flat belt (without tension pulley) | 4 ~5   |

In the case of chain transmission, load acting on sprocket wheel shaft is given by the formula (2.4) as same as that of belt transmission using value between 1.2 and 1.5 as chain factor corresponding to  $f_b$ .

### Bearing loads in gear transmission

In the case of power transmission by gear, methods of calculation vary depending on the type of gear since force acting on the gear is divided into radial load and axial load and their direction and ratio vary depending on the type of gear. In the case of the simplest flat gear, direction of load is radial load only and it is given by the following formula.

$$T = 9550P/N \dots \dots \dots (2.5)$$

$$F_t = 2000 \cdot T/d \dots \dots \dots (2.6)$$

$$F_r = F_t \cdot \tan \alpha \dots \dots \dots (2.7)$$

$$F_c = \sqrt{F_t^2 + F_r^2} \dots \dots \dots (2.8)$$

- T** : Torque acting on gear N·m
- F<sub>t</sub>** : Force in tangent direction of gear N
- F<sub>r</sub>** : Force in radial direction of gear N
- F<sub>c</sub>** : Combine force acting perpendicular to gear N
- P** : Transmitted power kW
- N** : Rotation per minute rpm
- d** : Pitch circle diameter of drive gear mm
- α** : Pressure angle of gear

Figure-3

Value that is given by multiplying theoretical load by gear factor  $f_z$  in Table-7 shall be used as actual load since degree of vibration and impact shock affecting the theoretical load obtained by the formula above varies depending on the type of gear and accuracy of gear surface finish.

$$F = f_z F_c \dots \dots \dots (2.9)$$

Table-7 Gear factor

| Type of gear                                                                                   | $f_z$    |
|------------------------------------------------------------------------------------------------|----------|
| Precision gear<br>(Both of pitch error and geometric error is 0.02 mm or less)                 | 1.05~1.1 |
| Ordinary machined gear (Both of pitch error and geometric error is between 0.02 mm and 0.1 mm) | 1.1 ~1.3 |

### Average load

Average load  $F_m$  which is converted so as to apply even life to each bearing may be used in the case that load acting on bearing is unstable and changes in various cycle.

#### (1) Fluctuating step load

Average load  $F_m$  is given by formula (2.10) in the case that bearing load  $F_1, F_2, F_3 \dots$  is applied with rotation speed and operation duration of  $n_1, n_2, n_3 \dots$  and  $t_1, t_2, t_3 \dots$  respectively.

$$F_m = \frac{[(F_1^{10/3} \cdot n_1 t_1 + F_2^{10/3} \cdot n_2 t_2 + \dots + F_n^{10/3} \cdot n_n t_n)]}{(n_1 t_1 + n_2 t_2 + \dots + n_n t_n)^{3/10}} \dots \dots \dots (2.10)$$

#### (2) Continuously fluctuating load

Average load is given by formula (2.11) in the case that the load can be expressed in function  $F(t)$  of time  $t$  with cycle  $t_0$ .

$$F_m = \left[ \frac{1}{t_0} \int_0^{t_0} F(t)^{10/3} dt \right]^{3/10} \dots \dots \dots (2.11)$$

#### (3) Roughly linear load

Average load  $F_m$  is approximately given by formula (2.12).

$$F_m = \frac{F_{min} + 2F_{max}}{3} \dots \dots \dots (2.12)$$

#### (4) Sinusoidal fluctuating load

Average load  $F_m$  is approximately given by formula (2.13) and formula (2.14).

$$(a): F_m = 0.75 F_{max} \dots \dots \dots (2.13)$$

$$(b): F_m = 0.65 F_{max} \dots \dots \dots (2.14)$$

### 3 Bearing accuracy

#### 3-1 Accuracy

Dimensional accuracy, geometrical accuracy and rotation accuracy of bearing are specified in ISO standards and JIS B 1514 (Rolling bearings - Tolerances of bearings).

Accuracy class of needle bearing is specified by four classes from lowest class 0 to 6th, 5th and 4th class in the highest. While high accuracy bearing in 5th or 4th class may be used in application for the case high rotation accuracy is demanded or high speed rotation, class 0 is used in most of general purpose application.

| 180                                  | 250   | +79                                                                                                             | +50 |
| 250                                  | 315   | +88                                                                                                             | +56 |

This means diameter of roller that achieves zero radial clearance in at least one radial direction in the case of using cylindrical roller instead of bearing inner ring.

\* Remark Although no particular shape is specified for chamfer surface, its outline in axial plane must be within virtual arc of  $r_s$  min radius that is tangent to slope of inner ring and inner diameter face of bearing, or tangent to side of outer ring and bearing outer diameter. (Reference diagram)

### 3-2 Measurement method

#### Measurement of single bore diameter

Table-12 Bearing bore diameter

| $\Delta_{ds}$<br>deviation of single bore diameter                  | Difference between single bore diameter and nominal bore diameter.<br>$\Delta_{ds} = d_s - d$<br>$d_s$ : Distance between two parallel straight lines which are tangent to intersecting line of actual bore diameter face and radial plane. |

Method of measurement of bearing bore diameter

Zero the gauge indicator to the appropriate size using gauge blocks or a master ring.

In several angular directions and in a single radial plane, measure and record the largest and the smallest single bore diameters,  $d_{sp\ max}$  and  $d_{sp\ min}$ .

Repeat angular measurements and recordings in several radial planes to determine the largest and the smallest single bore diameter of an individual ring,  $d_{s\ max}$  and  $d_{s\ min}$ .

Table-13 Measurement area limit Unit: mm

| r s min |         | a                       |
|---------|---------|-------------------------|
| Over    | or less |                         |
| -       | 0.6     | $r_{s\ max} + 0.5$      |
| 0.6     | -       | $1.2 \times r_{s\ max}$ |

| $V_{Dmp}$<br>Variation of mean outside diameter in a single plane      | Difference between maximum and minimum value of the mean outside diameter in a single plane in individual track ring with basically cylindrical outer diameter face.<br>$V_{Dmp} = D_{mp\ max} - D_{mp\ min}$                                                                                     |
| $\Delta_{Ds}$<br>deviation of single bore diameter                     | Difference between single outside diameter in basically cylindrical outside diameter face and nominal outside diameter.<br>$\Delta_{Ds} = D_s - D$<br>$D_s$ : Distance between two parallel straight lines which are tangent to intersecting line of actual outer diameter face and radial plane. |

Method of measurement of bearing outer diameter

Zero the gauge indicator to the appropriate size using gauge blocks or a master.

In several angular directions and in a single radial plane, measure and record the largest and the smallest single outside diameters,  $D_{sp\ max}$  and  $D_{sp\ min}$ .

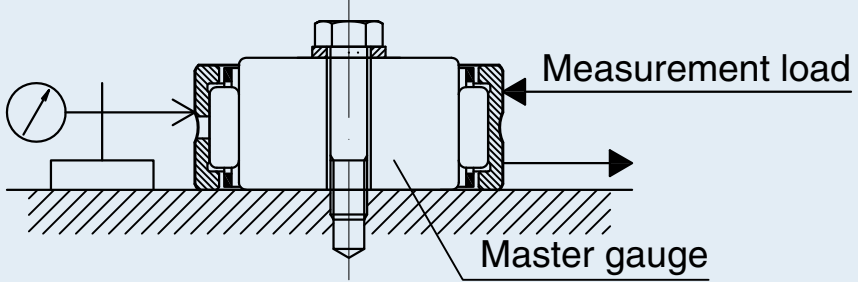

Repeat and record measurements in several radial planes to determine the largest and the smallest single outside diameter of an individual ring,  $D_{s\ max}$  and  $D_{s\ min}$ .

## Measurement of single bore diameter of rolling element complement

Table-15 Measurement of single bore diameter of rolling element complement

| Type and definition of accuracy                                              |                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| $F_{ws}$<br>Nominal bore diameter of rolling element complement              | Distance between two parallel straight lines which are tangent to intersecting line of inscribed circle of rolling element complement and radial plane in radial bearing without inner ring.                                                                              |
| $F_{ws\ min}$<br>Minimum nominal bore diameter of rolling element complement | Minimum nominal bore diameter of rolling element complement in radial bearing without inner ring.<br><br>Remark Minimum nominal bore diameter of rolling element complement is diameter of cylinder whose radial clearance becomes zero in at least one radial direction. |

Measurement of single bore diameter of rolling element complement

Fasten the master gauge to a surface plate.

Position the bearing on the master gauge and apply the indicator in the radial direction to the approximate middle of the width on the ring outside surface.

Measure the amount of movement of the outer ring in the radial direction by applying sufficient load on the outer ring in the same radial direction as that of the indicator and in the opposite radial direction.

Record indicator readings at the extreme radial positions of the outer ring. Rotate the bearing and repeat the measurement in several different angular positions to determine the largest and the smallest readings,  $F_{ws\ max}$  and  $F_{ws\ min}$ .

Table-16 Radial measurement load

| $F_w$<br>mm |       | Measurement load<br>N |
|-------------|-------|-----------------------|
| Over        | Incl. | min.                  |
| —           | 30    | 50                    |
| 30          | 50    | 60                    |
| 50          | 80    | 70                    |
| 80          | —     | 80                    |

## Measurement of single inner ring width (or outer ring width)

Table-17 Measurement of single inner ring width (or outer ring width)

| Type and definition of accuracy                       |                                                                                                                                          |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| $\Delta_{Bs}$<br>Deviation of single inner ring width | Difference between single inner ring width and nominal inner ring width.<br>$\Delta_{Bs} = B_s - B$                                      |
| $V_{Bs}$<br>Variation of inner ring width             | Difference between maximum and minimum value of the single bore diameter width in each inner ring.<br>$V_{Bs} = B_{s\ max} - B_{s\ min}$ |
| $\Delta_{Cs}$<br>Deviation of single outer ring width | Difference between single outer ring width and nominal outer ring width.<br>$\Delta_{Cs} = C_s - C$                                      |
| $V_{Cs}$<br>Variation of outer ring width             | Difference between maximum and minimum value of the single outer ring width in each outer ring.<br>$V_{Cs} = C_{s\ max} - C_{s\ min}$    |

Zero the gauge indicator to the appropriate height from the reference surface using gauge blocks or a master.

Support one face of the ring on three equally spaced fixed supports of equal height and provide two suitable radial supports on the bore surface set at 90° to each other to center the ring.

Position the indicator against the other face of the ring opposite one fixed support.

Rotate the ring one revolution and measure and record the largest and the smallest single ring width,  $B_{s\ max}$  and  $B_{s\ min}$  ( $C_{s\ max}$  and  $C_{s\ min}$ ).

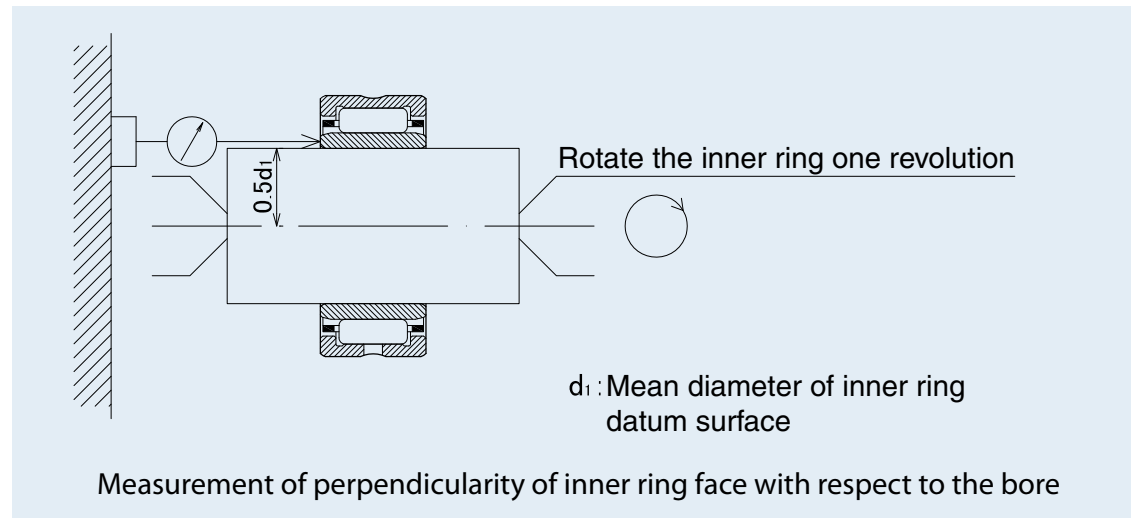

### Measurement of perpendicularity of inner ring face with respect to the bore ( $S_d$ )

Use a precision arbor having a taper of approximately 1:5000 on diameter.

Mount the bearing assembly on the tapered arbor and place the arbor between two centres so that it can be accurately rotated.

Position the indicator against the reference face of the inner ring at a radial distance from the arbor axis of half the mean diameter of the face.

Take indicator readings while rotating the inner ring one revolution.

### Measurement of perpendicularity of outer ring outside surface with respect to the face ( $S_D$ )

Support the reference face of the outer ring on a surface plate leaving the inner ring, if an assembled bearing, free. Locate the outer ring cylindrical outside surface against two supports set at  $90^\circ$  to each other to centre the outer ring.

Position the indicator directly above one support. The indicator and the two supports are axially located at the extremes of the measurement zone.

Take indicator readings while rotating the outer ring one revolution.

### Measurement of radial runout of inner ring ( $K_{ia}$ )

Use a precision arbor having a taper of approximately 1:5000 on diameter.

Mount the bearing assembly on the tapered arbor and place the arbor between two centres so that it can be accurately rotated.

Position the indicator against the outside surface of the outer ring as close as possible to the middle of the outer ring raceway.

Hold the outer ring to prevent rotation but ensure its weight is supported by the rolling elements. Take indicator readings while rotating the arbor one revolution.

### Measurement of radial runout of outer ring ( $K_{ea}$ )

Use a precision arbor having a taper of approximately 1:5000 on diameter.

Mount the bearing assembly on the tapered arbor and place the arbor between two centres so that it can be accurately rotated.

Position the indicator against the outside surface of the outer ring as close as possible to the middle of the outer ring raceway.

Hold the inner ring stationary. Take indicator readings while rotating the outer ring one revolution.

## 4 Internal clearance of bearing

### 4-1 Radial internal clearance of bearing

Radial internal clearance of bearing means a displacement of either inner ring or outer ring, which is free side, when the specified measurement load is applied to it alternatively in radial direction while locking the opposite component in the condition before mounting the bearing on shaft or housing. This measurement loads are quite small and they are specified in JIS B 1515:2006 (Rolling bearings - Tolerances). Radial internal clearance of needle bearing with inner ring is specified in JIS B 1520:1995 (radial internal clearance of bearing). Clearances shown in Table-18 are categorized in group C2, CN, C3, C4, C5 starting from smaller clearance and group CN is applied to general application.

#### ■ Radial internal clearance of bearing

Table-18 Internal clearance of radial bearing

| Category     | Description                                      |
|--------------|--------------------------------------------------|
| C2           | Radial clearance smaller than standard clearance |
| CN clearance | Standard radial clearance                        |
| C3, C4, C5   | Radial clearance larger than standard clearance  |

Table-19 Value of radial internal clearance of needle bearing

Unit:  $\mu\text{m}$

| d<br>Nominal bearing<br>bore diameter<br>(mm) |       | Clearance category |      |      |      |      |      |      |      |      |      |
|-----------------------------------------------|-------|--------------------|------|------|------|------|------|------|------|------|------|

Remark Nominal number C2,C3,C4 are displayed as part code suffix for these bearings (excluding CN clearance). Example) NA 4903 C2

### 4-2 Selection of radial internal clearance of bearing

#### Selection of clearance

Radial internal clearance of needle bearing in operation may generally becomes smaller than initial radial internal clearance. Temperature difference between inner and outer bearing during operation and fit cause this change. The radial internal clearance has a significant impact to life, vibration and heat generation of bearing.

Typically, larger radial internal clearance causes increase of vibration and smaller one results in heat generation or reduction of life due to excessive force between rolling element and track. Initial radial internal clearance may be selected as slightly larger than zero clearance in consideration for the internal clearance during operation. Bearing is designed to have suitable radial clearance by selecting CN clearance for general application.

#### Reduction of radial internal clearance due to fits

When bearing is installed to shaft or housing, radial internal clearance reduces due to expansion or shrinking of track with elastic deformation.

#### Reduction of radial clearance due to temperature difference between inner and outer ring

Friction heat generated by rotation of bearing will be released to outside through shaft and/or housing. In general application, radial internal clearance may be reduced as much as the difference of amount of thermal expansion between inner and outer ring since outer ring becomes cooler than inner ring due to larger heat release from housing than that from shaft.

## 5 Fits

### 5-1 Purpose of fits

Purpose of "fits" for a bearing is to fixate a bearing with sufficient "interference" between inner ring and shaft or between outer ring and housing. Insufficient "fits" may cause harmful phenomena which result in damaging bearing or shortening its life such as abnormal wear in fitting surface, abnormal heat by abrasion powder, abnormal rotation and vibration due to slip of fitting surface. Therefore, it is imperative to select proper fits for application.

### 5-2 Selection of fits

#### Condition for selection of fits

Selection of bearing "fits" needs to consider following points. Properties and size of load in application, condition of temperature, accuracy of rotation, material, finish, wall thickness of shaft and housing and easiness of assembling/disassembling.

"Fits" as shown in Table-20 is generally determined based on properties of load and condition of rotation.

Table-20 Properties of radial load and fits

| Properties of bearing load                                       |                                                                                              | Fits                                                                                                        |            |           |
|------------------------------------------------------------------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|------------|-----------|
|                                                                  |                                                                                              | Inner ring                                                                                                  | Outer ring |           |
| Load with rotating inner ring<br>Load with stationary outer ring |                                                                                              | Inner ring: rotation<br>Outer ring: stationary<br>Loading direction: constant                               | Tight fit  | Loose fit |
|                                                                  |                                                                                              | Inner ring: stationary<br>Outer ring: rotation<br>Loading direction: rotate together with outer ring        |            |           |
| Load with rotating outer ring<br>Load with stationary inner ring |                                                                                              | Inner ring: stationary<br>Outer ring: rotation<br>Loading direction: constant                               | Loose fit  | Tight fit |
|                                                                  |                                                                                              | Inner ring: rotation<br>Outer ring: stationary<br>Loading direction: rotate together with inner ring        |            |           |
| Load in inconsistent direction                                   | Direction of load is inconsistent due to varying load direction or including unbalanced load | Inner ring: rotation or stationary<br>Outer ring: rotation or stationary<br>Loading direction: inconsistent | Tight fit  | Tight fit |

#### Selection of fits

It is necessary to take condition of temperature and material of shaft and housing into consideration in addition to properties of load and rotation condition for selection of "fits" as mentioned above. Yet, it is common practice to determine "fits" based on reference to experience and past record because of difficulty for recognizing whole conditions. Table-21 and Table-22 show "fits" for general application and Table-23 shows "fits" for needle bearing without inner ring against shaft.

Table-21 Fits between needle bearing and housing hole

| Conditions                            |                                  | Tolerance grade for housing |
|---------------------------------------|----------------------------------|-----------------------------|
| Load with stationary outer ring       | Standard and heavy load          | J7                          |
|                                       | Split housing with standard load | H7                          |
| Load in inconsistent direction        | Light load                       | J7                          |
|                                       | Standard load                    | K7                          |
|                                       | Heavy load and impact shock load | M7                          |
| Load with rotating outer ring         | Light load                       | M7                          |
|                                       | Standard load                    | N7                          |
|                                       | Heavy load and impact shock load | P7                          |
| Light load and high rotation accuracy |                                  | K6                          |

Table-22 Fits between needle bearing with inner ring and shaft

| Conditions                                                            |                                               | Shaft diameter (mm) |       | Tolerance grade |
|-----------------------------------------------------------------------|-----------------------------------------------|---------------------|-------|-----------------|
|                                                                       |                                               | Over                | Incl. |                 |

## 6 Design of shaft and housing

### 6-1 Accuracy of fitting surface

Correct design and manufacturing of shaft or housing to which needle bearing is assembled are vital for adequate bearing performance since the needle bearing has thinner track ring compared to other types of rolling bearings. Table-26 shows dimension accuracy and geometric accuracy of "fitting" part of shaft and housing in standard application condition, surface roughness and tolerance of runout of shoulder against fitting surface.

Table-26 Accuracy of shaft and housing (recommended)

| Item                         | Shaft   | Housing |
|------------------------------|---------|---------|
| Roundness tolerance          | IT3~IT4 | IT4~IT5 |
| Cylindricity tolerance       | IT3~IT4 | IT4~IT5 |
| Shoulder runout tolerance    | IT3     | IT3~IT4 |
| Roughness of fitting surface | 0.8a    | 1.6a    |

### 6-2 Accuracy of track surface

Needle bearing can be directly attached to shaft or housing as track for compact bearing structure. In this case, accuracy and roughness of track surface must be equivalent to that of bearing track surface in order to ensure bearing life with high rotation accuracy. Since accuracy and roughness of shaft and housing may affect life and the cause of abnormality of the bearing.

Table-27 shows specification for accuracy and roughness of track surface.

Table-27 Accuracy of track surface (recommended)

| Item                      | Shaft | Housing |
|---------------------------|-------|---------|
| Roundness tolerance       | IT3   | IT3     |
| Cylindricity tolerance    | IT3   | IT3     |
| Shoulder runout tolerance | IT3   | IT3     |
| Surface roughness         | 0.2a  |         |

### 6-3 Material and heat treatment of track surface

Surface hardness of shaft and housing must be HRC58 to 64 in order to obtain sufficient loading capacity in the case of using them as direct track surface. Table-28 shows recommended heat treatment for their material.

Table-28 Material for track

| Type of steel                      | Representative example | Related standards |
|------------------------------------|------------------------|-------------------|
| High carbon-chromium bearing steel | SUJ2                   | JIS G 4805        |
| Chromium molybdenum steel          | SCM415~435             | JIS G 4053        |
| Carbon tool steel                  | SK85                   | JIS G 4401        |
| Stainless steel                    | SUS440C                | JIS G 4303        |

### 6-4 Skew of bearing

Skew between inner ring and outer ring generated by deflection of shaft due to external force or mounting error may result in reduction of life caused by abnormal wear or heat. While permissible amount of skew varies depending on type of bearing, load and bearing internal clearance, it is recommended to be 1/2000 or less for general application.

### 6-5 Mounting dimension for bearing

Dimension of shaft and housing for mounting needle bearing (Figure-8) is shown in dimension table for respective bearings.

Figure-8 Mounting dimension

#### Fillet radius and height of shoulder for shaft and housing

Maximum permissible radius ( $r_{as\ max}$ ) of fillet radius for shaft and housing to which needle bearings are assembled corresponds to minimum permissible chamfer dimension ( $r_{s\ min}$ ) of the bearings.

Minimum value of shoulder diameter of the shaft ( $d_a$ ) shall be nominal bore diameter ( $d$ ) of bearing plus its shoulder height ( $h$ ) multiplied by 2. Maximum value of shoulder diameter of the housing ( $D_a$ ) shall be outer diameter ( $D$ ) of bearing minus height of its shoulder multiplied by 2.

Table-29 Maximum permissible actual radius of corner R of shaft and housing  $r_{as\ max}$

Unit: mm

| $r_{s\ min}$<br>Minimum permissible chamfer dimension | $r_{as\ max}$<br>Maximum permissible actual radius of corner R of shaft and housing |

Height of shoulder and corner R

## 7 Lubrication

### 7-1 Purpose of lubrication

Purpose of bearing lubrication is to prevent its heat-seizure by mitigating friction and abrasion of rolling surface and slipping surface. Followings are the detailed explanation.

**(1) Mitigation of friction and abrasion**

It prevents direct contact between track, rolling element and cage.

It also mitigates friction and abrasion as a result of slip on track surface.

**(2) Removal of frictional heat**

Lubricant removes abrasion heat inside of bearing or heat propagated from outside to prevent excessive heat-up of the bearing.

**(3) Extension of bearing life**

Separating rolling element and track by oil film results in extension of bearing life.

**(4) Prevention of rust**

Oil film of lubricant mitigates oxidation inside and surface of bearing to prevent corrosion.

**(5) Prevention of dust**

Packed grease in the case of grease lubrication prevent invasion of foreign matter.

Efficient performance of these effects requires using lubrication method suitable for the application as well as selection of proper lubricant, its adequate amount, prevention against invasion of external foreign matter and optimal sealing structure in order to avoid leakage of the lubricant.

### 7-2 Comparison of grease and oil lubrication

#### Lubrication method

Lubrication method of bearing consists of grease lubrication and oil lubrication.

Grease lubrication is so popular for broad type of bearing because of its cost efficiency due to its simple sealing structure and a long duration of operating period with single filling. However, its disadvantage is larger flow resistance than oil lubrication in light of efficiency to large cooling capability and high speed application.

Oil lubrication has advantage in large cooling capability and high speed application due to its good flow characteristics. However, it demands design with consideration to sealing structure and leakage prevention. The Table-31 compares the two lubrication methods as a guidance for lubrication method selection.

Table-31 Comparison of grease and oil lubrication

| Item                     | Lubrication method |     |

## 7-3 Grease lubrication

### Filling amount of grease

Grease shall be packed up to volume approximately one-third to one-half of internal space of bearing or housing. Excessive grease may cause degraded lubrication performance due to leakage of softened grease or oxidation as a result of increased temperature inside of bearing. This should be critical especially in high speed operation.

Figure-9 shows an example of grease replenishment plan from side way using a ring with grease hole. Arranging grease holes evenly on circumference of the ring allows simultaneous entry of replenished grease into bearing for replacing old grease with new one. However, this design also allows standing old grease in opposite side space, which needs to be removed periodically by removing the cover.

### Lubrication grease

Grease is a semi-solid lubricant consisting of a base oil (liquid lubrication agent) and a thickener, which are combined on heating.

Table-32 Type and properties of grease (reference)

| Name                   | Lithium grease                                   |                                                  |                                                                                                    | Sodium grease                                                                                     | Calcium base grease                                                                                            | Aluminum grease                                                                | Non-soap grease                                                                                                                                                                                                                            |               |

It includes types showing superior properties in resistance to high and low temperature, and to chemical by combination with base oil and thickener<br><br>Versatile rolling bearing grease |               |

Remark Working temperature range is for general properties only and NOT for guarantee purpose.

#### 1) Base oil

Mineral oil and mixed oil are used for base oil of grease.

Diester oil and silicone oil are used as mixed oil.

Lubrication performance depends on viscosity of the base oil, and generally, low viscosity base oil is suitable for low temperature environment and high speed application, and high viscosity is for high temperature and high load application.

#### 2) Thickener

Thickener is a material to keep grease in semi-solid state. Type of thickener has impact to maximum working temperature, water resistance and mechanical stability.

Metal-soap base is popular for material of thickener. In addition, there are thickeners such as urea base thickener with high heat resistance, and sodium soap-base thickener with poor water resistance due to easiness to emulsifying by mixing with water.

### 3) Consistency

Consistency refers to the “softness” of grease and it is used as a guideline for showing flow characteristics. The larger the ASTM penetration No. is, the softer the grease is. Table-33 shows typical relationship between consistency of grease and its operating conditions.

Table-33 Consistency of grease and its operating conditions

| NLGI Grade No. | ASTM Penetration (1/10mm) | Operating conditions                               |
|----------------|---------------------------|----------------------------------------------------|
| 0              | 355~385                   | Centralized lubrication<br>Oscillating application |
| 1              | 310~340                   |                                                    |
| 2              | 265~295                   | General application                                |
| 3              | 220~250                   | General, high temperature application              |
| 4              | 175~205                   | Grease with sealed application                     |

### 4) Additives

Additives are material to improve performance of grease, which include antioxidants and extreme pressure additives added as necessary. Condition to use grease for long period without any replenishment requires added antioxidants to prevent oxidation.

Also, grease in operating conditions with heavy load or impact shock shall be selected from those with extreme pressure additives added.

### 5) Mixing different type greases

In principle, different brands of grease must not be mixed. Mixing different type grease is subject to negative impact each other due to change of consistency and difference of additives.

Table-34 Brand of lubricant grease (reference)

| Category                 | Brand                        | Manufacturer            | Thickener or soap-base | Consistency | Dropping point °C | Working temperature °C                                       | Remark                                                                                     |

## 7-4 Oil lubrication

Oil lubrication is more suitable than grease for high speed rotation with superior cooling efficiency. It is suitable for application that requests emission of heat to outside that are generated in bearing or added to the bearing.

### 1) Oil bath lubrication

Oil bath lubrication is the most popular method used in medium to low speeds. Amount of oil needs to be properly controlled with oil gauge. Most proper oil amount may be with oil level at the center of the lowest needle roller of bearing. Housing design with less variation of oil level is preferable.

### 2) Oil drop lubrication

Oil drop lubrication is broadly used in application with high speed and medium load due to its better cooling efficiency than oil bath lubrication. Oil dripping through oiler in this method removes friction heat in a method to lubricate with oil fog filling inside of housing by hitting rotating objects such as shafts and nuts. While amount of oil varies depending on type of bearing and speed, general amount should be a couple of drops per minute.

Figure-10 Oil drop lubrication

### 3) Oil splash lubrication

Oil splash lubrication is a method to splash oil with rotation of gear or disc. Unlike oil bath lubrication, it is applicable for relatively higher speed without having bearing in direct soak in oil.

### 4) Oil circulating lubrication

Oil circulating lubrication is widely used in application whose purpose is in cost efficiency for automatic lubrication with large number of lubrication spots, or is in cooling bearing. This lubrication method enables cooling or maintaining cleanness of lubricant with oil cooler and filters installed in oil circulation system. As shown in Figure-11, to make sure that lubrication oil is drained off certainly, it is important to have as much large outlet port as practical or forced outlet, setting inlet and outlet port of lubrication oil to opposite side each other to bearing.

Figure-11 Circulating lubrication

### Lubrication oil

Highly refined mineral oil such as spindle oil, machine oil or turbine oil, or mixed oil are used as lubrication oil for bearing. Additives such as antioxidants, extreme pressure additives or deparant are selectively used as necessary in accordance with application.

It is important to select oil with proper viscosity for operation temperature. Too low viscosity causes insufficient formation of oil film which results in abrasion or heat-seizure. Too high viscosity causes heat generation or loss of power due to viscosity resistance. In general, oil with higher viscosity is used for higher load and lower viscosity for higher speeds.

## 8 Bearing handling

### 8-1 Precaution

Bearings are an extremely precision mechanical components. Exercise great care for its handling. Followings are precautions for the handling.

#### 1) Keep bearings and surroundings clean

Foreign matters invaded inside of bearings such as dust and dirt have harmful effect in rotation or operation life on the bearings. Take extra precaution to maintain cleanness of bearing, surrounding components, work tools, lubricants, lubrications oil and working environment.

#### 2) Handle bearings carefully

Shocks such as caused by falling bearing may result in damage or impressions on track or rolling elements. They can be a cause of failure so that handle bearings carefully.

#### 3) Use proper tools

Make it sure to use work tools properly for bearing type for assembling and disassembling.

#### 4) Pay attention to rust

Although bearings are applied with anti-rust oil, handling with bare hands may cause generation of rust with perspiration from hands. Exercise care and use rubber gloves or apply mineral oil to hands when handling with bare hands.

### 8-2 Mounting

#### Preparation

Bearings should be mounted in clean and dry circumstance. Dirt on mounting tools should be removed prior to mounting work, then verify that dimension accuracy, shaft and housing roughness and geometric accuracy are within designed tolerance.

Packing of bearings should be opened just before start mounting. Fill lubrication grease without washing bearing in the case of grease lubrication. Washing is generally not required for oil lubrication as well. Still it is recommended to thoroughly wash out oil and grease when application demands high accuracy or lubricating performance is degraded by mixing lubricant and anti-rust agents.

### Mounting method

#### 1) Press fitting

In mounting bearings from small to medium sizes which don't need large forces, press fittings in room temperature are conducted widely. In this case, use pressing fixture as shown in Figure-12 to apply force evenly at side of bearing and press it in carefully. Applying high viscosity oil on fitting surface during work may reduce friction on the surface.

#### 2) Shrink fitting

Shrink fitting is broadly used for tighter interference or mounting large size bearing. How to fit is heating housing for outer ring and inner ring for shaft respectively with pure mineral oil with less corrosivity in order to expand their inner diameter for mounting onto the shaft. Heating temperature must not exceed 120° C. During mounting, inner ring could expand toward shaft direction so that it needs to be pressed against shoulder until completion of cool down to avoid gap between the inner ring and the shoulder.

### 8-3 Operation inspection

Operation inspection needs to be performed in order to confirm that bearings is properly mounted. Power operation at given speed without operation inspection may result in damage of bearings or heat-seizure due to lubrication failure in the case that mounting is insufficient. Shaft or housing should be rotated by hand after bearing mounting to confirm if there is no abnormality followed by check (or inspection) in stepping increase of speed from no load, low speed operation with power up to loaded operation.

Followings are typical abnormal items and major causes that can be checked in the operation inspection.

#### 1) Check item in operation by hand

- Fluctuation in rotation torque, Insufficient mounting
- Sticks and abnormal noise, Impression, damage, invasion of dirt or foreign matters in track surface
- Excessive torque, Insufficiently small clearance

#### 2) Check item in operation by power

- Abnormal noise, vibration ···· Impression, invasion of dirt or foreign matters in track surface, excessive clearance
- Abnormal temperature ······ Insufficient lubrication, insufficient mounting, insufficiently small clearance

### 8-4 Removing

Bearing may be removed for periodical machine maintenance or repair for trouble. Bearing and other components should be carefully disassembled in the same manner as the mounting in the case of re-using disassembled bearing or researching trouble condition.

Bearings should be carried out in an appropriate manner in accordance with type of bearing and condition of fits. Structure design should take disassembling work into consideration at planning stage of construction around the bearing since it would be difficult to disassemble especially the tight fit bearing.

#### Removing outer ring

Installing bolts for disassembling outer ring at several locations in circumference of housing will allow removing outer ring assembled with tight fits easily by tightening-up the screws evenly as shown in Figure-13.

Figure-13 Disassembling outer ring

#### Disassembling inner ring

Inner rings can be carried out most easily by pulling out by press (Figure-14). Dedicated removal tool (Figure-15) designed in accordance with dimension of the bearing is in use as well.

Figure-14 Disassembling inner ring 1

Figure-15 Disassembling inner ring 2

### 8-5 Maintenance and inspection

Periodical maintenance and inspection are essential for maximizing performance and prolonged usage of bearing as well as early discovery of abnormality of the bearings. Inspection items of bearings under operation include temperature, operation sound, vibration of bearings and condition of lubricant, whose observation enables judging timing of lubricant replenishment and replacement of components.

# CAM FOLLOWERS

# Cam follower with pre-installed grease nipple

**Newly available versatile cam follower which has conquered disadvantages in traditional products!!**

- CF..AB**  
Standard type
- CF..MAB**  
Stainless type
- CFH..AB**  
Eccentric type
- CFH..MAB**  
Eccentric stainless type

Ready use instantly after unpack the box thanks to pre-installed grease nipple.

•Conventional type: Need to fit a nipple

Lubrication available from both stud head side and thread side.No restriction for mounting location.

- NUCF..AB** Double-row cylindrical roller type
- stud diameter  
**16 to 30mm**

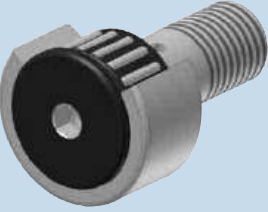

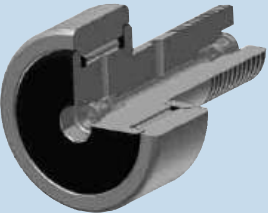

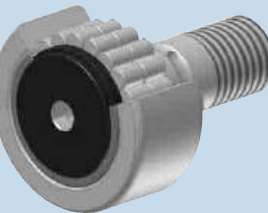

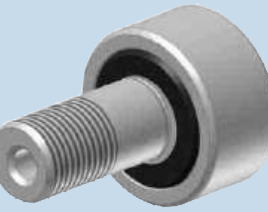

**No restriction for mounting location thanks to hexagon socket shape in stud head and thread side.Easy mounting and removal is available thanks to having hexagon socket shape in both side.**

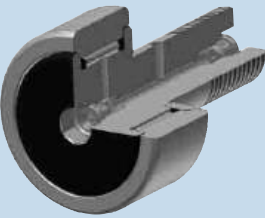

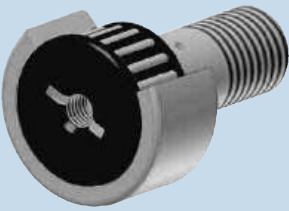

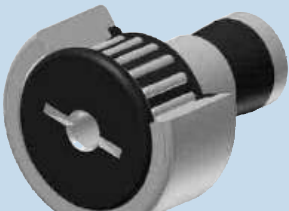

**No restriction for mounting location thanks to hexagon socket shape in stud head and thread side.Easy mounting and removal is available thanks to having hexagon socket shape in both side.**

## Type and Part Code

| Type                                                                                                                               | Applicable axis diameter | Feature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Part Code                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Structure and Features

Cam followers are compact and high rigid bearings with stud. It has a structure that an outer ring with built-in "roller" rolls over a track (raceway) and is utilized as guide roller for cam mechanism or linier motion. The cam follower is designed with a thick-walled outer ring in order to provide high rigidity to endure heavy load or impact load at contact portion with the track.

Outer rings have two shapes – crowned outer ring and cylindrical outer ring. The cylindrical outer ring is effective for heavy duty applications since it contacts with large contact area of the associated objects so that can mitigate the contact surface pressure. The crowned outer ring is suited for absorbing eccentric load since it absorbs angular misalignment due to a mount error. They have two internal structures – one with cage and one with full complement. Caged type cam followers are suited for high speed application, since the guiding feature of cage enables the rotation of "rollers" to be stable. Compared with caged type cam followers, full complement type is effective for applications with low-speed operation of heavy load due to its larger load rating. Full complement type also includes double-row cylindrical roller type which allows moderate axial loading.

Cam followers shall be fixed by tightening hexagon nut at stud thread by holding the stud with screw driver or hex-wrench.

Cam followers with eccentric axis on the stud thread have an advantage to adjust the variation of mounting position within its eccentric range, without requesting high machining accuracy of mounting hole position.

## Accuracy standard

Accuracy of cam follower is indicated in Table-1 and Table-2 below.

Unit:  $\mu\text{m}$

| Name                                                 | Category | Cam follower series in metric (CF--, NUCF--) |                        | Compact type (CFS--)   | Cam follower series in inch (CR--) |                        |

## Radial internal clearance

Table below indicates radial internal clearance of cam follower.

Table-3 Radial internal clearance

Unit:  $\mu\text{m}$

| Part code                          |                    |                                                   |                       | Radial internal clearance |      |
|------------------------------------|--------------------|---------------------------------------------------|-----------------------|---------------------------|------|
| Cam follower series in metric (CF) | Compact type (CFS) | Double-row cylindrical roller cam follower (NUCF) | Inch type series (CR) | min.                      | max. |
| CF3 ~ 5                            | CFS2.5 ~ 5         |                                                   | CR8 ~ 8-1             | 3                         | 17   |
| CF6 ~ 8                            | CFS6               |                                                   | CR10 ~ 10-2           | 5                         | 20   |
| CF10 ~ 12-1                        |                    |                                                   | CR12 ~ 22             | 5                         | 25   |
| CF16 ~ 20-1                        |                    |                                                   | CR24 ~ 26             | 10                        | 30   |
| CF24 ~ 30-2                        |                    |                                                   |                       | 10                        | 40   |
|                                    |                    | NUCF16 ~ 24                                       |                       | 0                         | 25   |
|                                    |                    | NUCF24-1 ~ 30-2                                   |                       | 5                         | 30   |

## Fits

Cam followers require machining of mounting hole to eliminate play at fitting portion especially for the portion which is subjected to impact shock due to its application in cantilevered mounting. Table-4 indicates recommended fits between cam follower and its mounting hole.

Table-4 Dimension tolerance of stud mounting hole

| Part code                                         | Dimension tolerance of stud mounting hole |
|---------------------------------------------------|-------------------------------------------|
| Cam follower series in metric (CF)                | H7                                        |
| Compact type (CFS)                                | H6                                        |
| Double-row cylindrical roller cam follower (NUCF) | H7                                        |
| Cam follower series in inch (CR)                  | F7                                        |

## Maximum permissible load

Permissible load of cam follower is subjected to change in accordance with bending strength and shear strength of its stud in addition to standard rating load of needle bearing due to its design with stud. This load is indicated as maximum permissible load.

## Track load capacity

Track load capacity means a permissible load under which the outer ring of cam follower and the mating surface are allowable to be used over a long period without causing any deformation nor compression mark. Track load capacity depicted in dimension table indicates a value for which hardness of steel mating material is assumed to be HRC40. In the case that the hardness of mating material is not HRC40, track load capacity in the dimension table shall be multiplied by value of track load factor obtained by Figure-1.

Figure-1 Track capacity factor

## Lubrication

All the JNS cam followers are lubricated with pre-packed high quality lithium soap-based grease grade 2 (RoHS compliant) so that they are ready to use. For applications requiring high prevention measure against invasion of foreign matter or leakage of lubricant, products with seal(part code--UU) which integrate special synthetic lubber with high abrasion resistance are also available.

Grease shall be packed up to volume approximately one-third to one-half of internal space of bearing. Lubrication interval varies depending on operation condition. Referential interval may be every six to twenty four months for cam followers with cages and every one to six months for full complement type with grease in the same type.

Some excessive grease may leak at the beginning of usage or immediately after re-greasing even for the products with seal. Aging operation period is recommended prior to application in which no contamination by grease is allowed in and around device. Wipe and clean any leaked extra grease after this operation.

Dedicated grease nipple shall be knocked in onto cam follower by pressing flange portion of the nipple using fixture shown in Figure-2.

## Accessories

Accessories for cam follower of standard specification are shown in Table-5. Dedicated grease nipple is available upon customer request by ordering products with suffix "N" added to part code.

Also, type CF-AB and type NUCF-AB have integrated dedicated concave grease nipples installed at both sides.

Figure-2

Example) CF 12 UUR-N  
└─ Dedicated grease nipple

## Mounting

### Mounting part

Hole for stud shall be perpendicular to mounting surface so as to ensure even contact between outer ring and rolling surface of mating material. Corner chamfer of hole shall be as small as around C0.5. Counter bore diameter shall be dimension  $f$  or more as described in the dimension table.

Type CF-R with crowned outer ring is recommended in the case of application with insufficient contact between outer ring and rolling surface of mating material.

Figure-3

### Mounting method

- Cam follower shall be mounted so as not to incline against direction of the motion.
- Mounting method to tighten cam follower directly to bracket by adding female thread to it without using nut as depicted in Figure-4 (A) is NOT recommended. This method may cause damage on stud due to concentration of bending stress in male thread portion in the event of loosening since it is difficult to tighten the stud sufficiently.

Figure-4

- For application with heavy load, lubrication hole of stud shall be located outside of loading range (on the side to receive load). Location of the lubrication hole is indicated by "JNS" marking on the side of stud flange. (Refer to Figure-5)  
Hole at the center of stud is used as stopper for tightening or lubricant supply hole for grease lubrication.

Figure-5

### Precaution for using spring washer

It is important to ensure that spring washer used for mounting cam follower has no burr or sharp edge. Debris scraped from nut or mounting bracket by burr or shape edge of washer during tightening can invade stud thread and can cause insufficient tightness or damage to thread.

### Tightening torque of stud

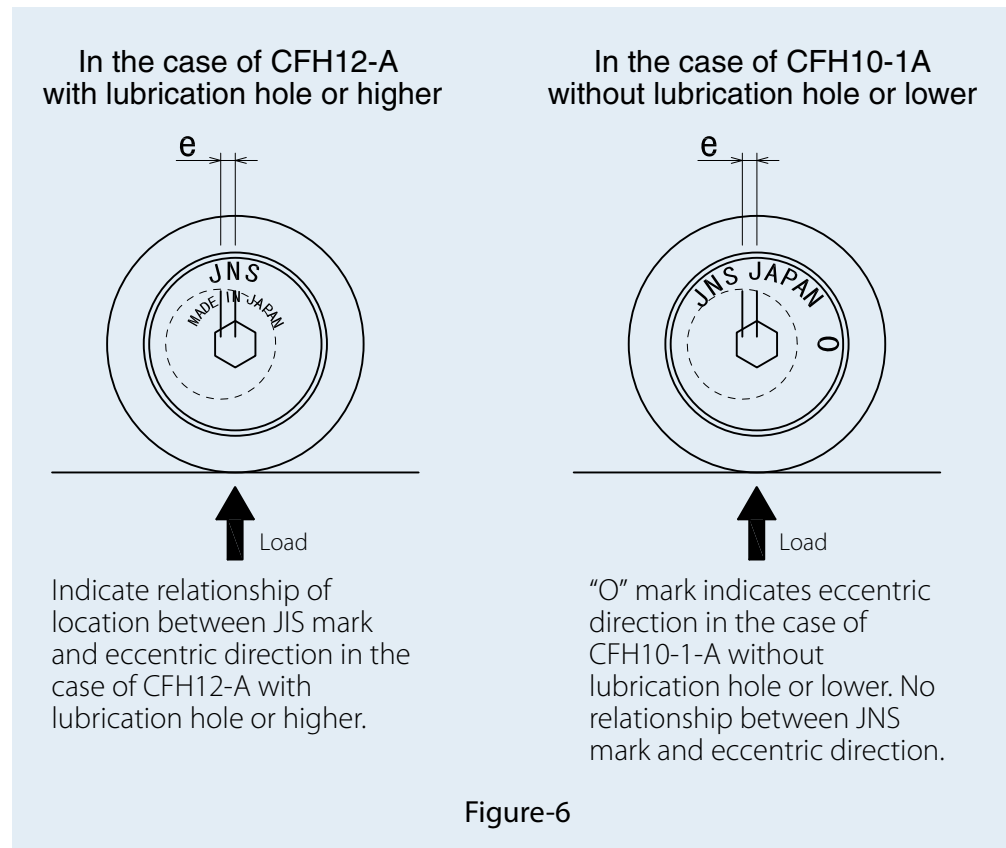

Stud of cam follower is subjected to bending stress or tensile stress by bearing load. Tightening torque shall be set not to exceed the value in the dimension table.

Using double spring washers, double thin nut of JIS B 1181 or special nut with locking feature is recommended in the case of possible loosening of mounting screw due to vibration or impact shock.

## Mounting of eccentric cam follower

Adjustment of eccentric shall be performed in accordance with the following procedure.

- (1) Insert stud to mounting hole and tighten nut as the stud can turn loosely. Marking of stud shall face location indicated in Figure-6 in relation to direction of load.
- (2) Gap between cam follower and mating contact surface may be adjusted by turning stud using hexagon hole on the stud head.
- (3) After completing adjustment, tighten nut with holding rotation of stud. Make it sure not to exceed maximum tightening torque of the nut.

## Mounting of CF-SFU type

Refer to Figure-7 for mounting method of easy mounting of CF-SFU type.

Type CF-SFU is NOT recommended for application in the part subjected to vibration or shock impact as much as its mounting is simple. Standard cam followers with nut are recommended for application with possible vibration or shock impact.

CF..AB TYPE has oil holes (grease nipple) which are prepared in the stud head and thread side, also an oil hole is prepared in the outer surface of stud.

\* Without seals, suitable for grease lubrication. In case of oil lubrication, up to 130% of this value shall be permissible, and 70% of this value shall apply for types with seals.

CF..AB TYPE has oil holes (grease nipple) which are prepared in the stud head and thread side, also an oil hole is prepared in the outer surface of stud.

\* Without seals, suitable for grease lubrication. In case of oil lubrication, up to 130% of this value shall be permissible, and 70% of this value shall apply for types with seals.

CFH..AB TYPE has oil holes (grease nipple) which are prepared in the stud head and thread side, also an oil hole is prepared outer surface of stud.

\* Without seals, suitable for grease lubrication. In case of oil lubrication, up to 130% of this value shall be permissible, and 70% of this value shall apply for types with seals.

## Structure and Features

Roller follower is a bearing with integrated "roller" featuring high rigidity. Its primary application is in a guide roller to have its contacting member travel in linear motion in direction of tangent using rotation of outer ring.

Outer ring of the roller follower is designed with thick ring in order to provide high rigidity to endure heavy load or impact load at portion to contact with the associated objects.

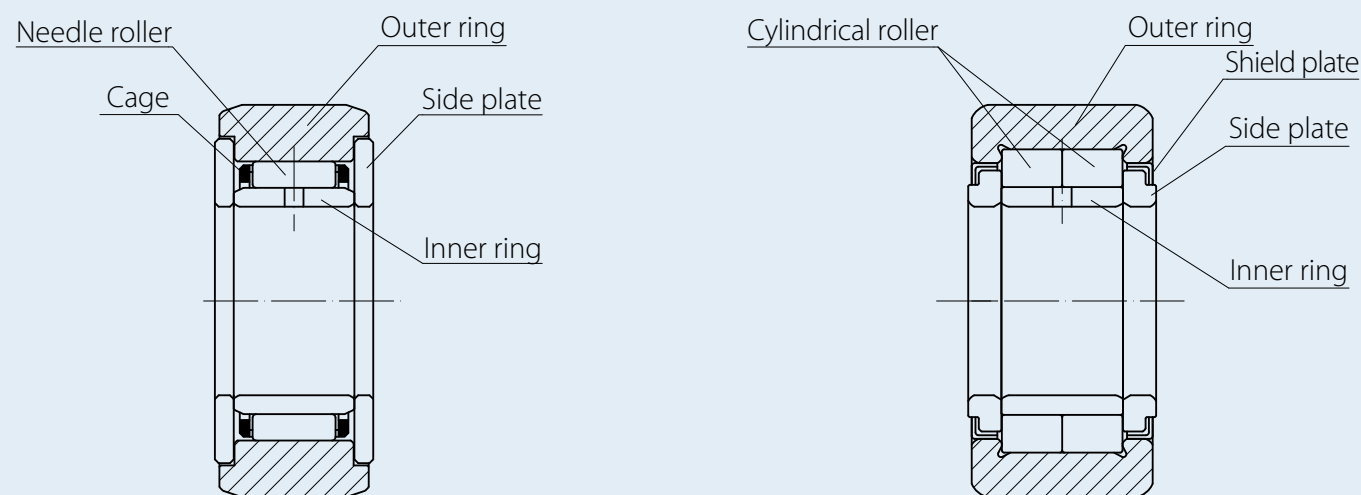

Type of roller follower mainly consists of separate type, which have separated inner ring and outer ring, and non-separate type, whose inner ring has fixed side plate.

Also, various types with shapes and structures are available in accordance with application. Outer rings have two types – crowned outer ring and cylindrical outer ring. The crowned outer ring is suited for absorbing eccentric load since it absorbs angular misalignment due to a mount error. Cylindrical outer ring is effective for heavy duty since it contacts with large contact area of the associated objects so that can mitigate the contact surface pressure. They have two internal mechanism – one with cage and one with full complement. A roller follower with cage is suitable for high speed application since the guiding feature of cage enables the rotation of "rollers" to be stable. Compared with cage type, full complement type is effective for applications with low-speed operation of heavy load due to its larger load rating. Full complement type also includes double-row cylindrical roller type which allows moderate axial loading.

Structure of type NART..UUR

Structure of type NAST..ZZ

Structure of type NURT

## Accuracy standard

Roller followers are manufactured in accordance with the following accuracies.

Unit:  $\mu\text{m}$

| Name                                                 | Category      | Crowned outer ring           |                        |
|------------------------------------------------------|---------------|------------------------------|------------------------|

## Radial internal clearance

Table below indicates radial internal clearance of roller follower.

Table-4 Radial internal clearance

Unit:  $\mu\text{m}$

| Part code   |               |                               | Radial internal clearance |      |
|-------------|---------------|-------------------------------|---------------------------|------|
| Separable   | Non-separable | Double row cylindrical roller | min.                      | max. |
| NAST6       | NART5R ~ 6R   |                               | 5                         | 20   |
| NAST8 ~ 12  | NART8R ~ 12R  |                               | 5                         | 25   |
| NAST15 ~ 25 | NART15R ~ 25R |                               | 10                        | 30   |
| NAST30 ~ 40 | NART30R ~ 40R |                               | 10                        | 40   |
| NAST45 ~ 50 | NART45R ~ 50R |                               | 15                        | 50   |
|             |               | NURT15R ~ 30-1R               | 0                         | 25   |
|             |               | NURT35R ~ 40-1R               | 5                         | 30   |
|             |               | NURT45R ~ 50-1R               | 5                         | 35   |

## Fits

Table below indicates recommended fits between roller follower and its mounting shaft.

Table-5 Shaft fits

| Type                          |                    | Tolerance grade |
|-------------------------------|--------------------|-----------------|
| Separable                     | Without inner ring | k5,k6           |
|                               | With inner ring    | g6,h6           |
| Non-separable                 |                    |                 |
| Double row cylindrical roller |                    |                 |

## Track load capacity

Track load capacity means a permissible load under which the outer ring of cam follower and the mating surface are allowable to be used over a long period without causing any deformation nor compression mark. Track load capacity depicted in dimension table indicates a value for which hardness of contacting steel member is assumed to be HRC40. In the case that the hardness of contacting member is not HRC40, track load capacity in the dimension table shall be multiplied by value of track capacity factor obtained by Figure-1.

Figure-1 Track capacity factor

## Lubrication

All the JNS roller followers are lubricated with pre-packed high quality lithium soap-based grease grade 2 (RoHS compliant) so that they are ready to use. For applications requiring high prevention measure against invasion of foreign matter or leakage of lubricant, products with seal (part code--UU) which integrate special synthetic lubber with high abrasion resistance are also available.

Grease shall be packed up to volume approximately one-third to one-half of internal space of bearing. Lubrication interval varies depending on operation condition. Referential interval may be every six to twenty four months for roller followers with cages and every one to six months for full complement type with grease in the same type.

Some excessive grease may leak at the beginning of usage or immediately after re-greasing even for the products with seal. Aging operation period is recommended prior to application in which no contamination by grease is allowed in and around device. Wipe and clean any leaked extra grease after this operation.

## Mounting

### Mounting part

- Thrust load may cause damage to side plate, outer ring or roller follower since it is designed so as to support load in radial direction. It is recommended to design and assemble to avoid thrust load.
- Application with roller follower without inner ring requires heat treatment and grinding finish of shaft. Surface hardness of the shaft shall be HRC58 to 64, and surface roughness shall be  $R_a$  0.2  $\mu$  m or less for this application.
- Side plate of non-separate type roller follower is pressed-in to fix it. Application in a manner to push the side plate shall be avoided in order to prevent risk of abnormal rotation under external force.
- Crowned outer ring is recommended in the case that contact between the outer ring and contacting member track surface is not smooth and even.
- When mounting NART, NAST-ZZ and NURT type, dimension "a" must be more than it described in dimension table in order to protect the side plate.

### Mounting method

To prevent pre-mature failure of roller follower, lubrication hole of inner ring shall be located outside of loading range (on the side to receive load).

CF..MAB TYPE has oil holes (grease nipple) which are prepared in the stud head and thread side, also an oil hole is prepared outer surface of stud.

\* Without seals, suitable for grease lubrication. In case of oil lubrication, up to 130% of this value shall be permissible, and 70% of this value shall apply for types with seals.

CF..MAB TYPE has oil holes (grease nipple) which are prepared in the stud head and thread side, also an oil hole is prepared outer surface of stud.

\* Without seals, suitable for grease lubrication. In case of oil lubrication, up to 130% of this value shall be permissible, and 70% of this value shall apply for types with seals.

CFH..MAB TYPE has oil holes (grease nipple) which are prepared in the stud head and thread side, also an oil hole is prepared outer surface of stud.

\* Without seals, suitable for grease lubrication. In case of oil lubrication, up to 130% of this value shall be permissible, and 70% of this value shall apply for types with seals.
